

Magic Photo Decal Paper (for Inkjet printer) Introduction:

1. Edit a photo or image with your graphic software such as Photoshop or Illustrator in your PC. Do not reverse the image as it will be applied right way up on the item.
**Only you may reverse it when you apply it on the other side of clear glass sheet, e.g. Car window interior (with or without tinting).
2. Set the paper condition of the printer to size "A4", "thick photo paper(HP) or premium glossy paper(Epson)" and print the decal image on glossy side of the inkjet decal paper using your colour inkjet printer. Dry the printed decal with a hair dryer for immediate use, or let stand for around 2 hours. **Clear inkjet decal paper can be used on white or light colour body. White inkjet decal paper should be used on black or dark colour body.
3. Cut out the decal with scissors around design carefully. Place decal face down onto gloss side of coating film then place then place the protection paper, gloss side down on top.
**The gloss side of protection paper must face down to the decal paper and coating paper.
4. Put them into the laminating machine carefully and laminate. Low speed laminating at low temperature, 110C or 120C, will make the laminated paper easier to handle when you cut and apply it. **Slow feed at low temperature and faster feed at higher temperature.
5. Cut out the coating paper with scissors around the design after removing the protection paper.
**Leave about 1~2mm margin to have better water protection effect and smoother finish.
6. Wet the paper of printed decal (printed side) with some wet tissue first. Slide off the paper after 30 seconds approximately.
7. Dip it into clean water to wet the other side of paper. **Use warm water in cold weather.
8. Place the decal face down onto the cleaned mug, and squeegee it by rubbing gently for about 1 minute and then slide off the backing paper. ** Get the mug wet before you apply the decal and do not try to remove the backing paper fast. It can be easily removed after minute. It is very important to clean off the glue left around the decal with wet tissues. Any glue left will cause yellowy spots on the image after baking.
9. Place the decal on right position by moving around with hand and rub up and down with the squeegee rubber to remove any water or air bubbles under the film completely.
**Be careful, any water or air bubbles left over could make a problem after baking. So, dry well before baking process.
10. Bake it in the microwave for about 5 minutes at low temperature(3 minutes at high temperature) or in the electric oven for about 7~8 minutes at 160C or 180C.
You can bake again to have better result of gloss and strong decal after cooling. You will have the similar result with hair dryer at high temperature for about 5 10minutes if your items can not be put in microwave or too large to put in. Put some water on the plate of microwave for glass plate or ceramic plate to avoid breakage. The baking time and the temperature above are only guidelines and we recommend you to start baking at lower temperature by 10~20 if you do not know the exact operating temperature of your oven or microwave. Longer baking will give you better results but over-baking could cause shrinkage problem of images.
